NIGRAH Intelligence Acquisition Framework (IAF v1)

Why This Document Exists

Every intelligence system is only as strong as its data.

Most hackathon projects fail at this point.

They build:

```
AI Model
↓
Dashboard
↓
Predictions
```

But they never answer:

Where does the intelligence come from?

For NIGRAH, intelligence acquisition is not a supporting component.

It is the foundation.

The entire Threat Signal Framework, Manipulation Pattern Framework, Scam Family Taxonomy, and Threat Index Engine depend on the quality of intelligence entering the system.

Core Principle

NIGRAH does not collect private investor data.

NIGRAH does not access bank accounts.

NIGRAH does not read personal messages.

NIGRAH operates exclusively on:

Public Intelligence

and

Publicly Available Threat Signals

This ensures:

- Privacy by design
- Regulatory compatibility
- Scalability
- Public-good compliance

which directly aligns with the hackathon guardrails.

Intelligence Source Hierarchy

Not all sources are equally reliable.

NIGRAH classifies sources into five intelligence tiers.

TIER 1

Regulatory Intelligence

Highest confidence.

These become the "ground truth" sources.

Source A1

SEBI Enforcement Orders

Information Extracted:

- Fraud Type
- Modus Operandi
- Entity Type
- Investor Harm
- Scam Lifecycle

Use Cases:

- Scam Family Discovery
- Pattern Validation
- Historical Intelligence

Reliability Score:

```
100/100
```

Source A2

SEBI Investor Alerts

Information Extracted:

- Emerging Fraud Types
- Red Flags
- Scam Techniques

Reliability:

`100/100`

Source A3

SCORES Complaint Categories

Information Extracted:

- Complaint Trends
- Investor Pain Points
- Recurring Threat Categories

Reliability:

`95/100`

Source A4

SEBI Registered Intermediary Database

Information Extracted:

- Valid Entities
- Registration Status

Use:

Authority Verification Engine

Reliability:

`100/100`

TIER 2

Government Intelligence

Source B1

RBI Fraud Advisories

Information Extracted:

- Financial Fraud Trends
- Payment Fraud Patterns

Reliability:

95/100

Source B2

CERT-In Advisories

Information Extracted:

- Fake Apps
- Fake Websites
- Cyber Fraud Patterns

Reliability:

95/100

Source B3

National Cyber Crime Portal

Information Extracted:

- Public Fraud Warnings
- Scam Trends

Reliability:

90/100

TIER 3

Judicial Intelligence

Source C1

Court Judgments

Information Extracted:

- Fraud Narratives
- Scam Evolution
- Network Structures

Reliability:

95/100

Source C2

Tribunal Orders

Information Extracted:

- Financial Misconduct Cases
- Market Manipulation Cases

Reliability:

90/100

TIER 4

Media Intelligence

This is where emerging threats often appear before regulatory action.

Source D1

Economic Times

Reliability:

80/100

Source D2

Moneycontrol

Reliability:

80/100

Source D3

Business Standard

Reliability:

80/100

Source D4

LiveMint

Reliability:

80/100

Source D5

Financial Express

Reliability:

80/100

Intelligence Extracted

From each article:

```
Scam Type

Fraud Mechanism

Financial Loss

Location

Date

Platform

Target Audience
```

TIER 5

Open Source Threat Intelligence (OSTI)

This is where NIGRAH becomes predictive.

Source E1

Public YouTube Content

Extract:

```
Promises

Claims

Language Patterns

Influencer Networks

Risk Signals
```

Reliability:

```
60/100
```

Source E2

Public Telegram Channels

Extract:

```
Signal Groups

VIP Groups

Referral Structures

Trading Claims
```

Reliability:

```
55/100
```

Source E3

Public Websites

Extract:

```
Return Claims

Registration Claims

Contact Information

Investment Offers
```

Reliability:

```
70/100
```

Source E4

Public Social Media Posts

Extract:

```
Financial Promotions

Screenshots

Testimonials

Marketing Claims
```

Reliability:

```
50/100
```

Intelligence Collection Pipeline

Every source enters the same pipeline.

Stage 1

Collection

Example:

```
SEBI Order

News Article

Telegram Channel

YouTube Video
```

Stage 2

Normalization

Convert source into:

```
{
 "source",
 "date",
 "region",
 "content",
 "platform"
}
```

Stage 3

Signal Extraction

AI identifies:

```
TS-01 Guaranteed Return

TS-03 Fake Authority

TS-06 Urgency

TS-09 Social Proof
```

Stage 4

Pattern Mapping

Signals become:

```
MP-01 Authority

MP-02 Greed

MP-03 Pressure
```

Stage 5

Scam Family Classification

Example:

```
Telegram Signal Fraud
```

Stage 6

Threat Index Calculation

Produces:

```
Threat Score

Confidence Score

Regional Score

Growth Score
```

Intelligence Freshness Model

One thing most systems ignore:

Time.

A scam from 2017 should not influence prediction as much as a scam from last week.

Recency Multiplier

```
Last 30 Days = 1.0

31–90 Days = 0.8

91–180 Days = 0.6

181–365 Days = 0.4

365+ Days = 0.2
```

This prevents stale intelligence.

Regional Intelligence Layer

Every intelligence record receives:

```
State

District

Language

Region
```

Example:

```
{
 "state": "Uttar Pradesh",
 "district": "Varanasi",
 "language": "Hindi"
}
```

This allows:

Regional Threat Maps

Example:

```
UP

Top Threat:
Telegram Signal Fraud

Threat Index:
88
```

Intelligence Reliability Formula

Every record receives:

Source Reliability Score (SRS)

Formula:

```
SRS

=

Source Trust

×

Evidence Quality

×

Recency
```

Example:

```
SEBI Order

100 × 95 × 100

=
95
```

Example:

```
Random Telegram Post

55 × 40 × 90

=
20
```

The NIGRAH Intelligence Graph

This is what eventually makes the system powerful.

Instead of storing:

```
Article
```

NIGRAH stores:

```
Threat Signal
↓
Pattern
↓
Scam Family
↓
Region
↓
Evidence Source
```

Meaning:

One SEBI order.

One court judgment.

One news report.

One Telegram pattern.

Can all strengthen confidence in the same scam family.

Strategic Observation

At this point NIGRAH is no longer a scam detector.

It has become a:

Financial Threat Intelligence Platform

with five complete layers:

Layer 1

Threat Signals

(25)

↓

Layer 2

Manipulation Patterns

(10)

↓

Layer 3

Scam Families

(30)

↓

Layer 4

Threat Index Engine

↓

Layer 5

Intelligence Acquisition Framework
